

Appendix B: Photos in the St Georges Terrace area

Photograph One: Site of the proposed signal controlled crossing at the junction of St George's Terrace and Broad Lane. The photograph shows that the majority of the civil engineering work associated with the signal controlled crossing was completed (including the poles and ducting for wiring of the signals) before work on site was stopped. A crossing in this location would improve access to the bus stop just visible in the background.

Photograph Two: Showing the relationship between the current toucan on Broad Lane (front of photo) and the proposed new crossing of St George's Terrace (on the right)
