

SCC proposes to uplift the cost of living allowance for people living at home and paying contributions for care and support. The proposal is informed by the outcome of a consultation.

SCC works out how much people can afford to contribute from their disposable income and aims to ensure people who live at home have enough income to cover costs of accommodation, cost of living and disability-related expenditure.

SCC currently uses the statutory Minimum Income Guarantee (MIG) to work out an individual's cost of living allowance. The MIG is different for each person and depends upon age, what type and rate of benefits received and other factors. The statutory MIG rates have not been increased by Government since 2016. This has a regressive impact on some people in that, year-on-year:

- as a person's income rises (specifically, annual benefit increases) the more SCC is entitled to take through a contribution:
- · but each year the MIG remains at 2016 rates, there is effectively a reduction in protected income available to cover cost of living (inflationary) increases.

Costs include household expenses, food, bills, utilities and certain travel expenses. While these may be significant in any year, the impact of Covid-19 on these costs (on top of health impacts) through more people being housebound is a further factor in the proposal.

The benefit system tends to advantage pension benefits through higher annual uplifts and triple-lock protection compared to working age benefits. The way contributions are calculated and MIG rates are applied, the regressive impact is weighted towards working-age adults, including younger adults.

SCC has monitored this impact year-on-year in the reasonable expectation that Government will announce an annual uplift in the statutory MIG rates. As this has failed to materialise, SCC is proposing to set its own, locally uplifted cost of living allowance. Various options have been considered for how best to achieve this, and remain on the table subject to the outcome of the consultation. Further analysis of each option is included in the embedded paper, 'Options for MIG.'

In summary, the options, and our view of each, are:

- 1. Uplift the cost of living allowance based upon people's ages could address impact on younger age adults but would have a limited impact overall.
- 2. Uplift the cost of living allowance based on increases to benefits would advantage people whose benefits rise highest (and would therefore still be expected to disadvantage working age adults).
- 3. Keep the MIG as it is but introduce discretionary payments administrative costs and barriers could affect take-up.
- 4. Introduce a maximum income level instead of a MIG people with the lowest incomes would see the least financial
- 5. Uplift the cost of living allowance as a flat rate increase to everyone would financially benefit the most people and mean that people with the lowest income would see the highest proportionate positive financial impact. This is the preferred option and, if agreed in principle, the rate of increase would then be determined.

For people who live in a care home or similar setting, a Personal Expenses Allowance is used instead of the MIG. The PEA has also remained fixed since 2016. The PEA is a smaller allowance, recognising that care home residents do not face household expenses in the way someone living at home does. A further option has been considered to uplift the cost of living allowance for care home residents. However, the relative financial impact of this is felt to be limited, when compared to household-related costs.

The preferred option remains a flat rate increase for people living at home. This takes account of all consultation feedback.
